## Symmetry and Physical Properties of Matter

This treatise presents the tensorial covariants (tensors belonging to particular irreducible representations) for all classical and magnetic crystallographic and the most important non-crystallographic point groups. Tensors up to rank 4 are considered. After an exhaustive theoretical introduction the material is presented in the form of comprehensive and complete tables. The calculation method is based on the principle of Neumann-Minnigerode-Curie, which requires that the structural symmetry of a physical object coincides with the symmetry of its properties, or with that of a subgroup. The complete knowledge of the tensorial properties is very useful for the calculation of molecular properties and for the study of various physical effects and quantities, e.g. the Raman effect, the electric and magnetic conductivities and susceptibilities. Since complete and consistent tables of tensorial covariants are not readily available in the literature, this work represents a valuable systematic endeavour to fill this gap.
